INTRODUCING

THE INDUSTRIAL ENERGY MANAGER PROGRAM FOR BC MANUFACTURERS

Canadian Manufacturers & Exporters (CME) and BC Hydro Power Smart have teamed up so that all BC manufacturers can now benefit from the expertise of an Industrial Energy Manager, enabling companies to:

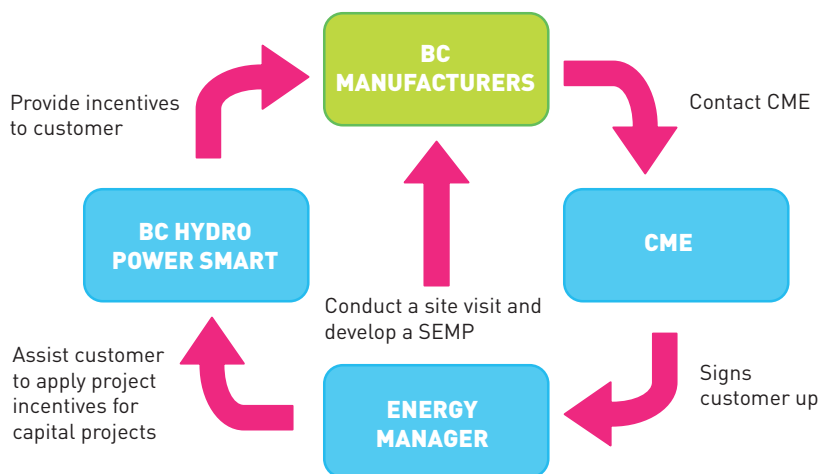

- Discover opportunities to improve energy efficiencies and save money.
- Implement new energy conservation opportunities.
- Access funding from Power Smart for new energy-efficiency projects.
- Develop a greener company culture to achieve ongoing savings.

THE OFFER

Just register for the program through CME and you will be assigned an Energy Manager who will visit your facility to create your customized Sustainable Energy Management Plan (SEMP).

The plan makes recommendations on how you can save money, based on sound energy management practices, improved operations and maintenance procedures, and new technology improvements.

If you decide to take advantage of any of the recommendations, your Energy Manager will work with you in applying for project incentives from BC Hydro Power Smart and project implementation.

SUCCESS STORIES

“The consultants in the Energy Manager program were able to pinpoint what was driving our costs up. We expect to reduce our electricity bill by 20 per cent over the next few months.”

— Hugh R. Alley,
Operations Manager,
Alco Ventures Inc.

“The Energy Management Assessment provided an excellent overview to better manage our energy usage... We came away from the assessment with 3 or 4 action plans where we thought we had a good chance to improve our energy consumption and lower our costs.”

— Doug Jeffrey,
President,
Nicholson Manufacturing.

BC Hydro Power Smart will typically pay 50–70 per cent of the cost of your energy efficiency project and buy your project down to a simple payback of 1–3 years.

HOW IT WORKS

The Industrial Energy Manager program is open to all BC Manufacturers and administered through the CME. If your facility uses more than \$50,000 of electricity annually, CME can arrange for an industrial energy manager to visit your site and create a customized Sustainable Energy Management Plan (SEMP). Here's what to expect:

1. THE PREPARATION

To assist your Energy Manager in uncovering all of your opportunities to save, you need to provide:

- An energy champion from your staff to lead this project
- A list of motors that are 5 hp and larger
- Facility information
- Operation information, e.g. hours of operation

2. THE SITE VISIT

The Energy Manager will conduct two main assessments at your site:

- The **Energy Management Assessment** will take two hours with your key management personnel to review your energy management practices
- The **Customer Site Investigation** will take one day with someone from your team who is familiar with your equipment and operations

3. THE PLAN

Following the site visit, your Energy Manager will provide you with a Sustainable Energy Management Plan that includes:

- A breakdown of your current energy consumption
- Opportunities for energy efficiency improvements
- Recommendations for Management Best Practices (MBP)
- An action plan

4. THE IMPLEMENTATION

The Energy Manager will assist you in implementing the identified energy saving opportunities, which include:

- Assistance in applying for the Power Smart project incentives for capital projects
- Implementation of the low cost/no cost operational and maintenance (O/M) projects
- Assistance in energy management recommended action items
